WebCTRL® Cloud Release Notes

DATE: OCTOBER 30, 2026
VERSION: 2026-Q3-SR25

WHAT'S NEW IN WEBCTRL CLOUD?

Operator Search Filter:

Managing large operator lists is now simpler. A new search filter lets administrators quickly locate operators by name, reducing time spent scrolling and manually browsing lists.

Benefits

- Instant search results: Operator lists update dynamically as you type.
- Role aware access: Only users with administrator permissions can access the operator list and search functionality.

Operator Duplication:

Administrators can now duplicate an existing operator to quickly create a new one with the same privileges and configuration. This feature helps streamline operator management by reducing manual setup and ensuring consistent access across users.

Benefits

- Copy existing operators to create new ones with retained privilege sets and related configuration.
- Modify details before saving, giving you flexibility during creation.
- Passwords are not copied—a new password is required to keep accounts secure.
- Available to administrators only, consistent with existing operator management permissions.

Privilege Set Duplication:

Administrators can now duplicate existing privilege sets (roles), rename them, and assign them to operators. This makes it faster and easier to create new roles that are based on proven configurations.

Benefits

- Save time by copying an existing privilege set instead of manually recreating permission.
- Flexible role creation: Duplicated roles can be renamed before being saved.
- Easy assignment: Newly created roles immediately become available for operator assignment.

WHAT'S NEW IN WEBCTRL CLOUD?

Privacy Consent:

Upon first login, both new and existing users who have not previously provided consent are prompted to review and accept the applicable privacy notice and EULA before proceeding.

Users can revoke their own consent from their settings, while administrators can reset privacy consent for all users. Privacy consent actions, including acceptance, revocation, and reset, are recorded in the audit log.

Password Viability:

Password entry has been improved with a new visibility control, allowing users to show or hide the password they are entering.

Visibility control is available in four areas of WebCTRL:

- Login/change-password workflow
- Admin password changes
- Operator creation
- Email credentials in System Settings

WebCTRL Browser Compatibility Updates:

This release includes UI changes required in response to browser-side deprecations.

Add-On Updates:

Numerous add-ons have been updated for security and compatibility purposes.

EIKON Enhancements:

Microblock Updates

Added unit types to microblocks previously missing them, such as network and parameter microblocks

ViewBuilder Enhancements:

Pipe and Duct Tool

The new Pipe and Duct Tool simplifies how pipe and duct graphics are created by letting you draw paths directly on the canvas instead of manually assembling and aligning individual images. Pipes and ducts are generated automatically, can be edited after drawing, and can dynamically change appearance using expressions (such as hot vs. chilled water). The tool also supports custom image sets, terminators, layered intersections, and snap to grid behavior.

Benefits

- Saves time by eliminating tedious manual image placement
- Reduces errors with intelligent constraints and automatic alignment
- Improves flexibility through expression based visuals and easy editing
